

## Perineal Tears and Repairs

<b>Key Document code:</b>	WAHT-TP- 094	
<b>Key Documents Owner/Lead:</b>	Dr Hillman	Consultant Obstetrician
<b>Approved by:</b>	Maternity Governance Meeting	
<b>Date of Approval:</b>	15 <sup>th</sup> November 2019	
<b>Date of review:</b>	15 <sup>th</sup> November 2022	

### Key Amendments

Date	Amendments	Approved by

### Introduction

Repair of perineal tears should be performed to reduce the long term morbidity of the women. Currently there is no evidence to support not repairing 2<sup>nd</sup> degree tears. The practice of leaving first and second degree perineal tears unsutured is associated with poorer wound healing and short-term discomfort. Therefore this Trust recommends all women who sustain 2<sup>nd</sup> degree tear should have their perineum repaired. If suturing is not undertaken clear documentation should reflect the reason why.

The principles of perineal repair apply to women who deliver in hospital or at home.

If the community midwife feels a perineal repair can't be undertaken safely in the home she should contact delivery suite and arrange for transfer in.

### Guideline

#### Definition of degree of tear

**First degree** Injury to perineal skin only.

**Second degree** Injury to perineum involving perineal muscles but not involving the anal sphincter.

**Third degree \*** Injury to perineum involving the anal sphincter complex:  
3a: Less than 50% of EAS thickness torn.  
3b: More than 50% of EAS thickness torn.  
3c: Both EAS and IAS torn.

**Fourth degree \*** Injury to perineum involving the anal sphincter complex (EAS and IAS) and anal epithelium.

\*Must be sutured by appropriately trained personnel who have successfully completed the RCOG approved workshop on repair of 3<sup>rd</sup> and 4<sup>th</sup> degree tear

#### Perineal Repair 1<sup>o</sup> and 2<sup>o</sup> Tear

Perineal repair is the responsibility of qualified medical staff and midwives. It should only be performed by staff that have been trained and supervised until they are fully competent.

1. Having explained the procedure, gained and documented verbal consent on K2 guardian the repair should be performed as soon as possible after delivery to minimise blood loss and discomfort, except following waterbirths where it is recommended to wait 30 minutes.
2. Adequate analgesia is essential. 1% Lidocaine infiltration is recommended, additional infiltration may be required for an episiotomy (see Midwife Exemption DA/ME/03).
3. Count of swabs instruments and needles to be undertaken by two people before procedure and recorded on K2 guardian A full examination, per vaginum and per rectum, to determine the extent of the tissue damage should be performed. If there is any doubt to the extent of the tear the midwife must ask for a second opinion and abandon the repair if necessary.

4. The repair should be undertaken from a clean surface. Adequate lighting is essential. The woman should be in the most appropriate position, in hospital this will probably be lithotomy. At home the community midwife needs to ensure whichever position the woman is in is safe for the woman and midwife and allows adequate access and vision of the perineum.
5. A lithotomy pack should be used with the woman appropriately draped to assist in maintaining a “clean” area to work from.
6. Vicryl 2.0 rapide should be used routinely for the repair. The reason for using any different suture material should be clearly documented. The apex must be visualised and the posterior vaginal wall and muscle layer repaired using a continuous stitch. The rationale behind the continuous technique is that stitch tension due to reactionary oedema is transferred throughout the whole length of the single knotless suture in comparison to interrupted stitches, which are placed transversely across the wound.
7. Subcuticular suture to skin is preferred method. Interrupted may be used if there is clinical need or the clinician is untrained in subcuticular suturing.

At the end of the procedure:

- Remove any pack if used from the vagina.
- Perform a vaginal examination to check haemostasis and correct anatomical alignment has been achieved and that the introitus is not too tight.
- Perform a rectal examination to check that sutures have not penetrated the rectal mucosa and that sphincter function is present.
- Count swabs and needles, and dispose of these safely - the count should be undertaken by two people and completed on K2 system or locally agreed documentation (i.e. MLU/homebirth)
- Ensure the woman is comfortable and explain the repair.
- Advice should be given regarding care of the perineum including pelvic floor exercises and hygiene and documented on K2 guardian
- Administer analgesia as appropriate (e.g. Diclofenac suppository 100mg PR see Midwife Exemption DA/ME/01).
- Ensure infiltration and description of repair is recorded in K2 guardian

### Management of 3° and 4° Tear

When third and fourth-degree repairs are performed, it is essential to ensure that the anatomical structures involved, method of repair and suture materials used are clearly documented and that instruments, sharps and swabs are accounted for and recorded on K2 guardian

The woman should be fully informed about the nature of her injury and the benefits to her of follow-up. Having explained the procedure and gained consent from the woman the repair should be performed as soon as possible after delivery to minimise blood loss and discomfort. Evidence of this should be recorded on K2 guardian

There is a steady increase in litigation related to obstetric anal sphincter injury. The majority are related to failure to identify the injury after delivery, leading to subsequent anal incontinence and rectovaginal fistulae. (RCOG 2007)

- This procedure must be carried out by a medical practitioner that has successfully completed the RCOG approved workshop on repair of 3<sup>rd</sup> and 4<sup>th</sup> degree tear or supervised by a consultant.
- Repair in an operating theatre will allow the repair to be performed under aseptic conditions with appropriate instruments, adequate light and an assistant.
- Regional or general anaesthesia will allow the anal sphincter to relax, which is essential to retrieve the retracted torn ends of the anal sphincter. This also allows the ends of the sphincter to be brought together without any tension.
- A full examination to determine the extent of the tissue damage should be performed and include both a VE **and** PR after suturing.

- Technique: Either end to end or overlap repair is acceptable. End to end technique will be easier for partial tears of the EAS.

2.0 Vicryl Rapide to repair anal mucosa - knots inside ano-rectal canal.

2.0 or 3.0 PDS to repair anal sphincter. The rest of tear sutured as normal repair as mentioned above.

At the end of the procedure

- Give prophylactic IV antibiotic – 1.2g co-amoxiclav unless penicillin allergic. If patient known to be severely penicillin allergic i.e. anaphylaxis discuss with consultant microbiologist.
- Ensure adequate analgesia post delivery. Avoid the use of codeine if possible as it is a constipant.
- Complete Datix form

Management in the Postnatal Period

- Encourage oral fluids
- Encourage adequate fibre in diet
- Prescribe a postnatal laxative e.g. Lactulose 10 – 15 mls twice daily for 7 days
- Perineal checks should be performed by midwife and advice given re hygiene
- Follow up out-patient appointment should be made for review at approximately 6 months:
  - Patients will be offered earlier follow up at Pelvic Floor After Pregnancy Clinic if clinically indicated. The “Pelvic Floor after Pregnancy Clinic” referral form should be completed at the time of delivery and sent to Monica Williams, Secretary to Miss Blackwell at WRH (WRH deliveries only) see Appendix 2.
- Refer to postnatal ward physiotherapist highlighting review required following 3<sup>rd</sup> or 4<sup>th</sup> degree tear:
  - Women’s Health Physio Bleep 302/502, Ext 33710 WRH
  - Physio Bleep 0153 Ext 42114 AlexComplete the patient’s name and reason for review on the Physiotherapy Assessment Form (WR1345/46) and put in Physio folder on the ward.
  - Physios will see patients on postnatal ward to discuss postnatal care and Pelvic Floor Exercises
  - Physios will phone patients at 6 weeks postnatal to assess pelvic floor function
  - Patients will be reviewed by a specialist physiotherapist at 3 months to assess pelvic floor function and may have EMG studies.
  - Consultant follow up can be expedited if necessary
- All patients with 3<sup>rd</sup> or 4<sup>th</sup> degree perineal tears will receive an appointment to attend the Pelvic Floor After Pregnancy Clinic
- A timely and documented explanation should be provided to ensure the woman is fully informed of the extent of the tear and likely or possibly contributory factors.

### **Management of women returning with problems relating to any type of perineal repair**

Review by medical staff.

If re-admitted, Consultant Obstetrician should be involved with this decision and ongoing plan of care. A Datix-web incident form should be completed.

### **Management of women with a previous third degree tear in a subsequent pregnancy**

Patients with a previous third or fourth degree tear are at increased risk of a recurrent third or fourth degree tear. The risk of a recurrent third or fourth degree tear is quoted to be 5%

We do not have facilities for endoanal ultrasound or anorectal manometry at WAHT.

#### **a) BOOKING VISIT – See Consultant:**

First enquire about anorectal symptoms:

*Faecal urgency, flatal and/or faecal leakage*

- 1) **Asymptomatic** (with none of the above symptoms at any time following previous tear)  
May be suitable for vaginal delivery

**Options for discussion with patient:**

1: **Vaginal birth** - explaining risk of recurrent 3<sup>rd</sup> or 4<sup>th</sup> degree tear.

2: **Caesarean Section** - explaining risks of caesarean section as well as explaining that caesarean section may not absolutely protect against later bowel symptoms as pregnancy alone can cause deterioration in anal sphincter control.

If patient very keen on vaginal delivery refer for endoanal ultrasound scan (lead Consultant/Gynaecologist to determine efficacy and arrange scan)

If patient wishes caesarean section, plan elective caesarean section as mode of delivery after 39/40.

If patient undecided, review 2-4 weeks in antenatal clinic by Consultant or consider refer to Pelvic Floor After Pregnancy Clinic for further discussion.

2) **Symptomatic**

Significant risk of deterioration of symptoms following subsequent vaginal delivery.

**Offer elective caesarean section** after 39/40, explain risks of caesarean section as well as explaining that caesarean section may not absolutely protect against later bowel symptoms as pregnancy alone can cause deterioration in anal sphincter control.

3) **Severely symptomatic**

Counsel carefully. **The damage is done already. Consider vaginal delivery** and later referral to colorectal for further treatment of bowel symptoms. Patient may still request elective caesarean section after 39/40.

4) **Previous elective secondary sphincter repair following pregnancy:**

Not suitable for vaginal delivery. **Offer elective LSCS**

b) **FOLLOW UP ANTENATAL VISIT**

**See Consultant if mode of delivery not yet confirmed**

Review endoanal ultrasound scan and manometry results

Offer Elective Caesarean Section if abnormal endoanal scan (i.e. >25% sphincter defect) +/- abnormal manometry (i.e. squeeze pressure increment <20mmHg)

Support patient if still wishing vaginal delivery

c) **36/40 FOLLOW UP IN ANTENATAL CLINIC**

Any patient planning a vaginal delivery after a 3<sup>rd</sup> or 4<sup>th</sup> degree tear should be seen by the consultant in Antenatal Clinic at 36/40 to ensure vaginal delivery is still appropriate.

**Management of women with anorectal symptoms in the absence of a past history of third degree tear**

Refer to colorectal surgeons and manage pregnancy as above.

**Management of women with a previous third degree tear in a subsequent labour**

The birth should be facilitated by an experienced midwife, not a junior student midwife, however it is recognised that a student midwife would benefit from providing effective, supportive care for these women.

Elective episiotomy is NOT indicated, only if clinically indicated at time of crowning.

Perineal repair should be done by an experienced practitioner with careful attention to the integrity of the EAS.

Patients attending in labour with an elective caesarean booked for previous third degree tear should not be encouraged to attempt a vaginal birth. Caesarean section should be performed as an emergency procedure.

APPENDIX 1

**PELVIC FLOOR AFTER PREGNANCY CLINIC  
REFERRAL FORM**

**WORCESTERSHIRE ROYAL HOSPITAL**

Please complete this referral at delivery for all women  
who sustain a 3<sup>rd</sup> or 4<sup>th</sup> degree tear  
and send to Monica Williams, Secretary to Miss A Blackwell
